

FitBuddy Project

Topic 1 – FastAPI Framework

FastAPI is the Python web framework used as the backend of FitBuddy.

Key Points

- Handles web routes and API endpoints.
- Receives user input from forms or API requests.
- Connects the frontend with the AI and database layers.
- FitBuddy routes include the home page, workout generation, feedback submission, and admin view.
- Uvicorn is used to run the FastAPI application locally.

Project relevance: This topic is one of the required pre-requisites for developing and running the FitBuddy application.
