

# FitBuddy Project

## Topic 4 – Python Programming

Python is the main programming language used to implement FitBuddy.

### Key Points

- Python handles application logic and data processing.
- Functions separate AI generation, database operations, and route logic.
- Pydantic models validate incoming data.
- Exceptions can be handled for invalid requests.
- Python packages are installed using pip and isolated with a virtual environment.

**Project relevance:** This topic is one of the required pre-requisites for developing and running the FitBuddy application.
