

FitBuddy Project

Topic 5 – Git and Version Control

Git is used to track changes to the FitBuddy source code.

Key Points

- A Git repository stores project history.
- Commits record meaningful changes.
- Branches can be used for separate feature development.
- A .gitignore file should normally exclude virtual environments, databases, and .env secrets.
- Version control helps restore earlier versions and supports collaboration.

Project relevance: This topic is one of the required pre-requisites for developing and running the FitBuddy application.
