

FitBuddy Project

Topic 6 – SQLAlchemy and SQLite

SQLite is a lightweight database and SQLAlchemy is the Python ORM used to work with database records.

Key Points

- SQLite stores application data locally.
- SQLAlchemy maps Python classes to database tables.
- FitBuddy stores user ID, name, age, weight, goal, and intensity.
- Generated and updated plans are stored for later viewing.
- Database helper functions save, retrieve, and update users and plans.

Project relevance: This topic is one of the required pre-requisites for developing and running the FitBuddy application.
